

SIFTA: Commercial Viability Response

Prepared 2026-06-14

One-page answer to Philippe's checklist: use case, demo, differentiation, users, pilots

Evidence: local code + tests

Positioning

Short answer: yes, SIFTA can be saleable if it is positioned as a receipt-backed local agent operating system for high-trust actions, not as another generic multi-agent framework. The wedge is owner-silicon autonomy: one owner intent, one nonce, one auditable action, and no double-spend.

1. Concrete use case

A local, auditable AI workbench for regulated or safety-sensitive workflows where a buyer must prove what the agent saw, who authorized it, what tool/action ran, and whether a second spend/action was refused.

First saleable wedge

- Agent-commerce guard: purchase/action intent rows before effectors.
- MCP tool receipt wrapper: world-touching tools are classed and gated.
- Owner-body effector guard: local hardware and camera/body receipts, not cloud-only policy.
- Robot/proof lane: real IK datasets ingested as virtual effectors before any metal claim.

2. Five-minute demo

- Open Alice and show /cortex: multiple brains are arms of one local body.
- Ask Alice to list her real body files: answer comes from disk inventory.
- Run one receipt-gated action: owner intent -> nonce -> allowed effector.
- Attempt the second spend/action: show the refusal receipt.
- Show robotics E49/E50 evidence: real datasets, virtual effector receipts, no metal overclaim.

3. Evidence checked today

- 59 focused tests passed: commerce gate, MCP manifest, E49/E50 robotics, MiMo lanes, self-improvement spinal/substrate.
- E49 ABB IRB 2400: Kaggle dataset path, 18-column schema, virtual effector round-trip.
- E50 ARKOMA NAO: real pose-to-joint dataset slice and virtual effector lane.
- MiMo/Cline/OpenRouter truth: Xiaomi MiMo endpoint is not overclaimed as OpenRouter.

4. Why not just CrewAI / LangGraph / SDKs?

Those are orchestration libraries. SIFTA's claim is a product stack: local hardware continuity, four-ledger receipts, owner-intent nonces, cortex switching, body-file self-knowledge, and testable effectors. The differentiator is not 'agents called ants'; it is accountable local autonomy with proof before action.

Actual users

Current active operator/user: George on local Apple-silicon node. Public customer count: not yet proven. Treat this as founder-led pilot stage.

Revenue / pilots

Do not overclaim revenue. The next sellable milestone is one paid pilot or LOI around a specific receipt-gated workflow.

Ask to Philippe

Give us 30 minutes: watch the five-minute demo, then help choose one narrow pilot where auditability beats a generic agent stack.

Truth boundary

Operational: local code, ledgers, tests, E49/E50 virtual effectors, MiMo/Cline cortex visibility, owner-intent nonce gate. Hypothesis: broad market pull, physical robot motion, revenue, and claims that SIFTA outperforms every framework. Forbidden: saying it is already a mature SaaS, a public token/payment network, or proven AGI.

Useful reply line: 'It is saleable if we sell the receipt-backed local trust layer first, then prove one paid pilot.'
